

Title: "Station with Control Panel"

Summary: (no Fig.)

The invention refers to a station, in particular machining, measuring, conveying station and the like which is in particular arranged in a machining or production line, with at least one control device with control panel for indication, control and/or diagnosis functions of the station.

The invention is characterised by the fact that the control panel is connected portably and wireless with at least one station, respectively control device of the station, and/or a central control unit of the machining or production line.
